Responsibilities

We designated tasks based on each team member's strengths and skillsets. Emily has taken IAT 339 prior to this course so felt comfortable handling the majority of the web coding. Zoe has taken IAT 235 prior to this course and felt comfortable with the visual design aspects.

Emily

- Website programming
- D3 visualizations
- Creating dataset

Zoe

- Website design
- Website Content
- Copy writing
- Creating dataset

Zoe Mann - ZM

Emily Youngward - EY

Decisions Rationale

We chose a scrolly-telling structure to take users on a step by step journey through the decades. We wanted to control the order that information is conveyed in to tell a story about ticket price inflation and popular artists from the 1980s to now. After going through each decade of top grossing concerts, we reveal to the user the all-time best performing concerts as well as the most expensive average ticket prices. We did this to first give parts of the story, and then the big picture.

For each decade, we chose to show actual gross revenue, adjusted gross revenue, and amount of tickets sold. This way, users can see how the data changes based on different measurement criteria. The all-time chart shows both actual and adjusted gross revenue. This allows for comparison between concerts from all decades and lets us see which concerts outperform each other based on two different measurements. Lastly, the

most expensive ticket chart lets us see which tours would have cost the most on average to attend. The purpose of this chart is shock value and lets the user reflect on what they learned previously.

In addition to our data visualizations, our design is minimalist to draw attention to the data. We included a microinteraction of a progress bar that references a digital music player. We also added a guessing feature right before the most expensive tickets chart. This makes the user draw their own conclusions about the data before it's revealed who the greediest artist really is. It also adds interaction and personalization, engaging the user with the story.

Challenges

We faced challenges with making the visualizations in our website responsive. We overall found it challenging to represent our visualizations on such a small screen. Ultimately, we decided to remove most text while maintaining the tooltips to ensure the visualizations were still legible. We feel relying on tooltips works because our website is not meant for mobile.

We also faced challenges with our x-axis text. For the All-Time chart the x-axis text was too overwhelming and busy due to the amount of tours being represented. So we decided to remove the x-axis text all together. We believe this works because users are able to explore the visualizations themselves with the tooltip feature. With the visualizations for the decades we had issues with the x-axis text being unreadable, we fixed this by making the text larger as it was originally only at 10px.

Lastly, we faced challenges with the visual design of the website. We felt that our initial design did not convey our story well and had many distracting elements taking away from the data. Therefore, we changed our visual design direction to a more minimalist design that draws more attention to the data.
